PSA Confusion

Posted February 13, 2013

Dr. Myers introduced the concept of different disease populations to explain how the first dose of Taxotere can cause the PSA to bloom from, say, 80 to 170, then crash to undetectable with the second dose. The truth about disease progression rests with bone scans and CT, not PSAs, with the new agents coming on. These populations are stem cells, and positive and negative PSA. MD Anderson did the studies. It will take more explaining for the writer and his associates to grasp these new variables. He has promised to do so from Orlando meeting.
